

Google Fusion Tables

This heat map shows domestic crime statistics for the past 12 years in relation to NSW local government areas

Zooming in on an area shows detailed statistics

Would you like to be able to easily create visual maps to illustrate your research data?

Would you like the ability to help users understand your data without having to trawl through tables of figures?

Then our Data Visualisation workshop using Google Fusion Tables could be the course for you!

Google Fusion Tables is an experimental data visualization web application to gather, visualize, and share larger data tables.

By the end of the workshop you'll have the skills necessary to import, sort and merge your data and create heat maps, by working on a fictional but plausible social science research project.
