

#### **HPC**

Introduction to Unix and HPC

#### What is HPC?

- HPC, or high-performance computing, refers to the application of supercomputers or clusters of computers to computational problems that typically arise through scientific inquiry
- HPC is useful when a computational problem:
  - <u>Is too large</u> to solve on a conventional laptop or workstation (because it requires too much memory or disk space) or
  - Would take too long (because the algorithm is complex, the dataset is large, or data access is slow) or
  - Are too many High Throughput Computing

#### Parallelism on HPC

- HPC systems often derive their computational power by <u>exploiting parallelism</u>
- Programs for HPC systems must be split up into many smaller "sub-programs" which can be executed in parallel on different processors
- HPC systems can offer parallelism at a much larger scale, with 100's or 1000's, or (soon) even millions of tasks running concurrently.
- Writing <u>parallel software can be challenging</u>, and many existing software packages do not already support parallelism & may require development.

NOTE: Many tasks cannot be parallelised

#### Reasons to use HPC

- You have a program that can be recompiled or reconfigured to use optimized numerical libraries that are available on HPC systems but not on your own system.
- HPC applications are already installed on the HPC machines which is a non-trivial task
- You have a "parallel" problem, e.g. you have a single application that needs to be rerun many times with different parameters.
- You have an application that has already been designed with parallelism
- To make use of the <u>large memory</u> available
- Our facilities are <u>reliable</u> and regularly backed up

#### When not to use HPC?

- You have a <u>single threaded job</u> which will only run one job at a time (typical of MatLab users)
- You rely on <u>Databases</u>
- You have a lot of <u>data to transfer</u> between your local machine and the HPC on a continuous basis (e.g. per job)
- You <u>need to have a GUI</u> to interact with your program

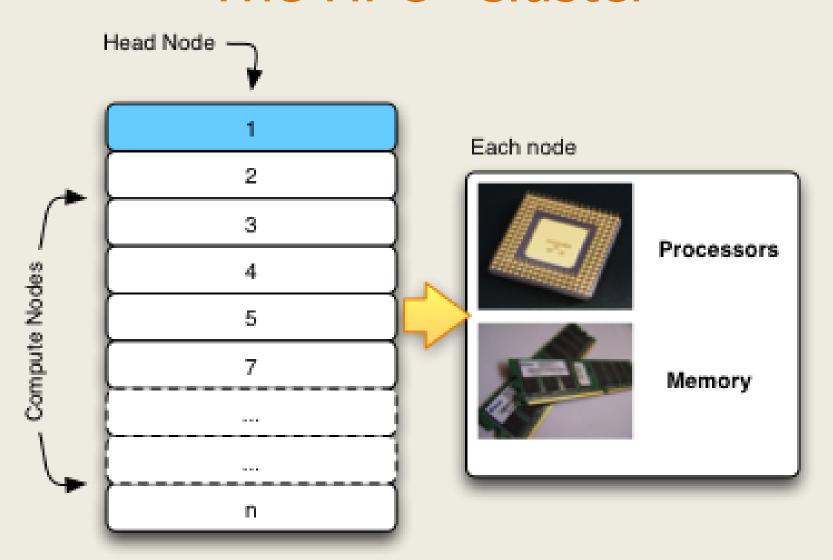

### **HPC** machines

System	Memory Architecture	Cores	Nodes	Memory
Octane (training machine)	Distributed	48	3	48GB
Orange	Distributed	1,600	100	8ТВ
NCI – (Vayu)	Distributed	11,936	1492	37ТВ
NCI – (Name TBA) • available May 2013	Distributed	57,472	3592	158TB

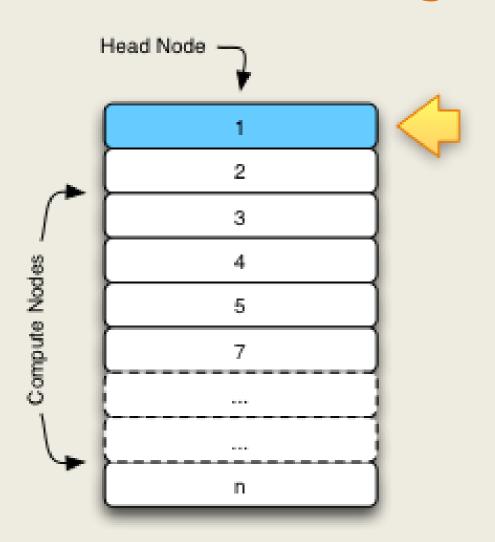

## The typical HPC workflow

- In HPC we talk about jobs, these are simply commands we wish to run and requests for resources (e.g. compute time, disk space, memory requirements, setup of s/w env's etc.)
- Generally time consuming & resource intensive.
- Jobs are typically run non-interactively,
- Can be run interactively for testing purposes
- We add our jobs to a queue.
- When machines have free resources jobs run
- Once jobs are complete, we can inspect their output.

### The HPC "Cluster"

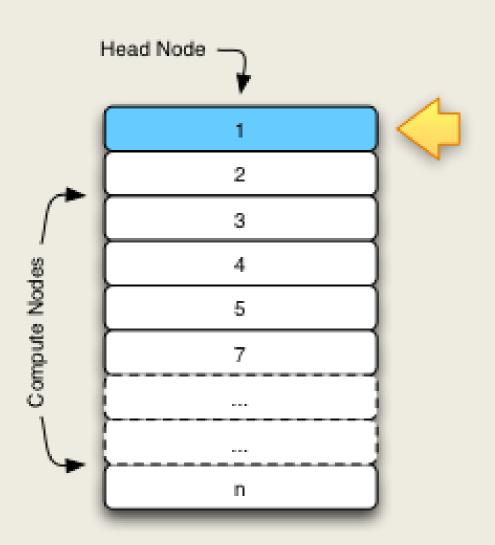

### The Login Node

#### **Login Node**

- Interactive programs
- SSH sessions
- Testing
- Compiling

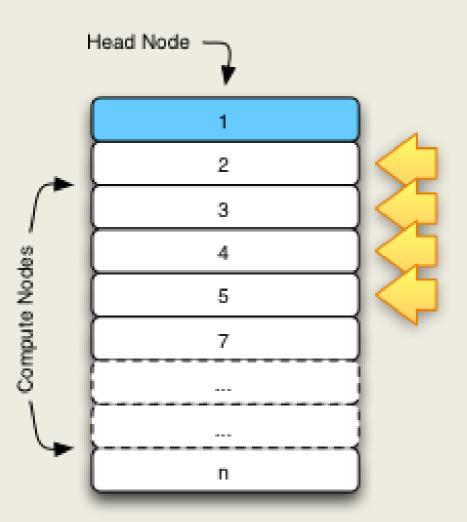

#### The Head Node

#### **Head Node**

Queuing jobs

## Compute Nodes

- These run your jobs
- Managed by the scheduler
- Typically you will not interact with the nodes directly (some users may need to)

# **Queuing Systems**

- Portable Batch System (PBS) is the name of computer software that performs job scheduling.
   Its primary task is to allocate computational tasks, i.e., batch jobs, among the available computing resources.
- The following versions of PBS are currently available:
  - OpenPBS
  - TORQUE
  - PBS Professional (PBS Pro)
  - ANU PBS
- Guide to PBS: <a href="http://hpc.sissa.it/pbs/pbs.html">http://hpc.sissa.it/pbs/pbs.html</a>

## Queuing Systems cont.

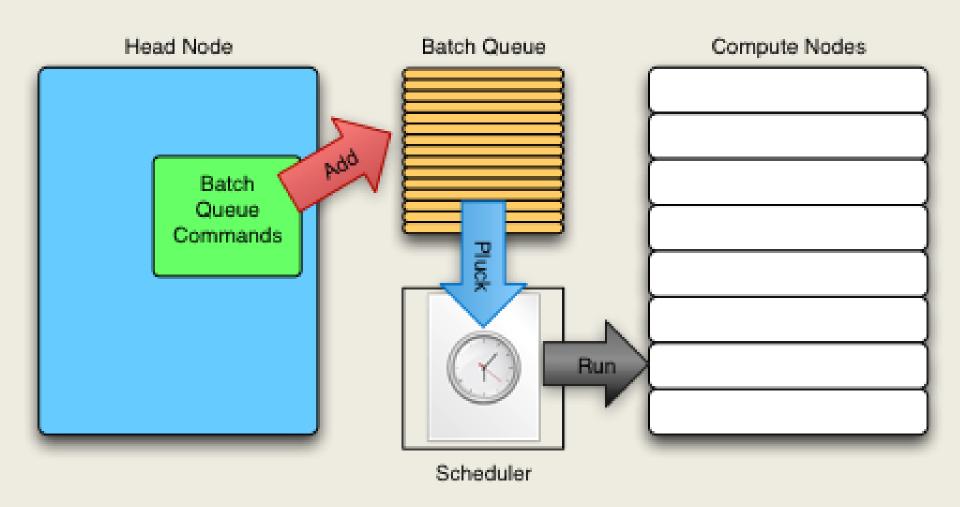

- Another popular batch system is **SLURM** (Simple Linux Utility for Resource Management)
  - Open source, fault-tolerant, and highly scalable cluster management and job scheduling system for large and small Linux clusters.
  - Very useful for use on clusters
  - Platform Tools used by IBM
  - Used by many supercomputers, e.g. TERA 100 at CEA (Europe's most powerful supercomp.)
- Many banks and commercial entities using batch systems

#### ANU PBS vs PBS Pro

- ANU PBS is a <u>customised version of PBS based on</u>
   <u>OpenPBS 2.3</u> maintained by ANU
- Details of ANU PBS modifications are found here: <a href="http://anusf.anu.edu.au/~dbs900/PBS/local\_modifications.html">http://anusf.anu.edu.au/~dbs900/PBS/local\_modifications.html</a>

Batch System	ANU PBS	PBS PRO
Machines using	Vayu & NCI New Facility	Orange & Octane
Code Base	OpenPBS 2.3	PBS Professional
Licence	ANU Licence	Altair Licence

# The Batch Queuing System

## Batch Queuing component

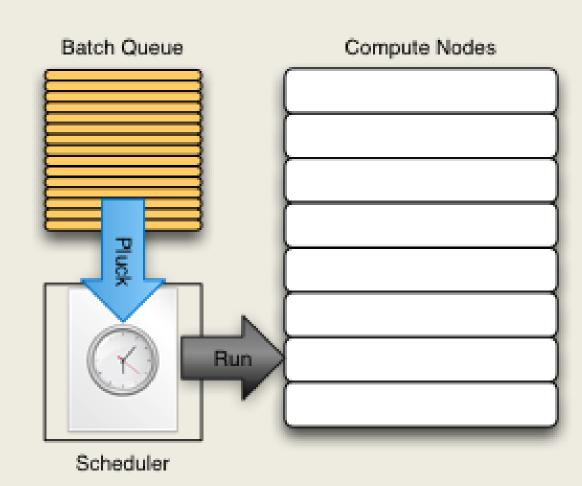

Head Node

- The batch system is a normal program
- Lets you add and remove jobs from the queue and monitor the queue
- Script/command line driven

## The Scheduler component

- Allocates jobs to compute nodes
- Optimizes usage of resources
- "Optimize" can mean many things
- Non-trivial
- Never interact with directly

#### **PBS Pro Commands**

In order to use the batch system productively, we need to know how to perform three actions:

- Add a job to the queue
- Remove a job from the queue
- See where our job is in the queue

Command	Description
qsub <job-script></job-script>	Submit a job (add to queue) Returns a <job-number></job-number>
qdel <job-number></job-number>	Delete job (remove from the queue)
qstat <job-number></job-number>	Monitor jobs
qalter <job-number></job-number>	Modifies the attributes of the job or jobs

#### Exercise 1

#### Monitoring the queue with qstat

Command	Description
qstat -a	List all jobs in the queue
qstat -u <username></username>	List all jobs of a particular user
qstat -f <job-number></job-number>	Show detailed information about a job
nqstat	ANU PBS only! Shows detailed information about all jobs

#### All about Modules

#### What do Modules do?

- Set up the environment for a software package
- Adds paths to executables to \$PATH
- May change other shell variables, and/or load other modules.
- Allow you to have different versions of the same software package, e.g. load the Intel compilers v23 with module load intel/12, or if you require an older version, you can load it with module load intel/9

### All about Modules (cont.)

#### Things to know about modules

- No <u>default module loaded when you login</u>. You can change this by adding lines to your .bashrc file (BASH users) or similar for other Shells
- Modules exist for many packages but <u>not for all!</u>
- Some modules exclude each other, e.g.
  - You can't load Intel compilers v8 & v9. You can only load one.
  - You can only load 1 MPI (e.g. MPT or Intel or OpenMPI)

#### **Module Commands**

Command	Description
module avail	Will list all available module files in the current MODULEPATH
module load/unload	Will load/unload a modulefile into the shell environment e.g. module load mpt/2.06
module list	List all loaded modules
module show [modulefile]	Will show information about the modulefile

## Add a job to the queue

- To add a job to the queue, we write a job script. A job script is a simply a script.
- The # symbol signifies a comment for the Shell
- It has some special comments that pass info to PBS Pro.
- #PBS is a keyword for PBS and specifies that this line is for PBS. The Shell will ignore it
- When we want to queue the job, we pass its filename as a parameter to qsub, e.g.
  - qsub <job-script>
- The batch queuing system will return a number that uniquely identifies the job.

#### Useful Environment Variables

These are available in the context of your job script.

Command	Description
PBS_O_WORKDIR	The directory the job was submitted from
PBS_JOBID	The job number given when the job was submitted

## A sample PBS job script

NOTE: This script will not run on Orange as resources are assigned via Groups on Orange, not via projects

```
#!/bin/bash
# Request resources
# * 10 minutes wall time to run
#PBS -1 walltime=00:10:00
# * 1 node, 1 processor
#PBS -l nodes=1:ppn=1
# * 100 megabytes physical memory allocated to job
#PBS -1 mem=100mb
# Specify a project code (for accounting)
#PBS -P a40
cd $PBS O WORKDIR
# Specify the job to be done
date
sleep 10
date
```

## You've got mail!

```
# Set email address
#PBS -M fred@intersect.org.au
# Send an email when jobs
# begins (b), gets aborted (a)
# and ends (e)
#PBS -m abe
```

#### Exercise 2

#### Create a script and submit a sample job

Command	Description
#PBS	#PBS is a keyword for PBS and specifies that this line is for PBS. The Shell will ignore it
#	Signifies a comment for the Shell, e.g. # Next line will create a job
qsub	Submit a job to PBS
qstat	List jobs in the queue
<pre>cat <filename></filename></pre>	Print a file to the terminal (catenate)
<b>less</b> <filename></filename>	Like cat, but less at a time
nano <filename></filename>	Will open file <filename> in a text file editor</filename>
Sample PBS Script	http://www.intersect.org.au/orange-handbook

## Job limits on Orange

- 200 hours of walltime
- 64GB of memory per standard node.
   e.g. 128GB for 2 nodes etc.
- 256GB of **memory** per large memory nodes
- NOTE: If you grab a node with 64GB, you can effectively use about 60GB as the OS uses memory

#### **Priorities of Jobs**

In order of importance, jobs are prioritised in this order:

- 1. Resources available to the project
- 2. Walltime
- 3. Number of jobs (fair share)

### Best strategy

- Submit jobs constantly/daily
- Have about 10-20 jobs in the machine
- Be realistic with walltime
- Don't ask for resources you don't need!

### **NCI** Facilities

Disk Type	Disk Usage
VAYU (Commissione d in 2010)	<ul> <li>Sun Constellation Cluster with 1492 nodes, each containing 2 quad core Nehalem processors summing up to 11,936 cores. 37TB RAM and 800 TB disk space. Uses QDR (quad data rate) – predecessor to FDR</li> <li>Global memory address space where shared memory programs can run</li> <li>The unit of shared memory parallelism is the node, comprised of 2 sockets with 4-core CPU's = 8 cores.</li> </ul>
NCI Upcoming System (available in May)	<ul> <li>2 sockets with 8-core CPU's = 16 cores</li> <li>57,472 cores in the compute nodes</li> <li>Approximately 160 TBytes of main memory;</li> <li>Infiniband FDR (fourteen data rate) interconnect</li> <li>Approximately 10 PBytes of usable fast file system (for short-term scratch space).</li> </ul>

### **NCI** Facilities

VAYU	New NCI Facilities
66% of Nodes have 32Gb (2Gb/core)	96.5% of Nodes have 24Gb/node
33% of Nodes have 64Gb (4Gb/core)	3.2% of Nodes have 48Gb/node
2% of Nodes have 128Gb (8Gb/core)	0.3% of Nodes have 96Gb/node

#### Software on NCI

Area	Software
Computational Chemistry	ABINIT, Amber, CPMD*, GULP*, NAMD*, Molpro etc.
Bioinformatics	AbySS, BEAST, BIOPERL, Cufflinks, MAW, etc.
Math Libraries	ARPACK, BLACS, Boost, FFTW, GSL, MKL, Tao
Statistics & Maths Env's	Maple*, Mathematica*, MatLab*, Octave*, R, Stata*

- Asterisked items indicates that discussion with NCI facility staff is required before use (Licensing issues)
- http://nf.nci.org.au/facilities/software/index.php

## Orange Physical Disks

Which of the 3 disks to use and when?

Type	Disk Type	Disk Type	Disk Usage
1	Panasas	59Tb	<ul> <li>Parallel global file system</li> <li>All nodes see the Panasas disks <ul> <li>directly attached to each node</li> </ul> </li> <li>Very fast for large files</li> <li>Can be slow if you copy MANY small files</li> <li>System director blade creates metadata for each file</li> </ul>
2	SGI	50Tb	<ul> <li>An NFS mounted file system</li> <li>All nodes see the SGI disks</li> <li>can only be seen via NFS backbone</li> <li>Uses old technology, therefore very robust</li> <li>Scales nicely for clusters up to 100 Nodes (very good for Orange)</li> </ul>

# Orange Disks (cont.)

Which of the 3 disks to use and when?

Type	Disk Type	Disk Type	Disk Usage
3	Local	200Tb	<ul> <li>Exist in each node</li> <li>No network is necessary making these the fastest disk</li> <li>If you have a lot of I/O, you should copy your data to here and work here</li> <li>One 2Tb disk in each compute node</li> <li>Is only accessible within that node as it's not attached to any network, therefore cannot be accessed by another node</li> <li>NOTE: The lifetime of files on this disk is only for the duration of the runtime of the job – The user must copy back results. If not, the next job will erase any files</li> </ul>

# Disk Partitions - Orange

/home	
Mounted under:	/home/username
Disk Type	SGI Disks
Size:	60GB default
Backed up:	Yes
Speed:	Intermediate disk (SGI Disks)
Life time:	Permanent

## Disk Partitions - Orange

/projects/project-name		
Mounted under:	/projects/project-name	
Disk Type	Panasas Disk	
Size:	no default size	
Backed up:	Yes	
Speed:	High speed	
Life time:	Till end of the running year - merit allocation period	

 There will also be some "repository space" for large datasets, such as bioinformatics databases

## Disk Partitions - Orange

/data2		
Mounted under:	/data2 on each node	
Disk Type	Scratch Disks	
Size:	Limit of disk - 2TB	
Backed up:	No	
Speed:	Fastest	
Life time:	Job duration	

**Warning**: This partition is shared among users, so can be "filled up" (with other jobs) while your job is running!

#### **Disk Partitions**

You can find out more about the partitions on the HPC machine using the **df** command.

Command	Description
df -h	Show disk free space for all partitions in human readable format

You can find out more about current disk usage, using the **du** command.

Command	Description
du -hs .	Show disk usage of current directory in human readable format

### Quotas

- There is no quota on scratch disks for performance reasons.
- The quota on /projects/project-name depends on your allocation.
- 60 GB soft limit for /home.
- 80 GB hard limit for /home (30 days).

### More Info on NCI & Orange

- Read more about Orange and NCI Facilities
  - http://www.intersect.org.au/hpc-news
  - http://www.intersect.org.au/orange
  - http://www.intersect.org.au/nci\_next
- Sample PBS Script & Info on Orange
  - http://www.intersect.org.au/orangehandbook

#### Resource Allocation Round

- Merit-based system by which Intersect members can gain access to our HPC facilities
- Applications reviewed by HPC staff (for <u>technical</u> <u>complexity</u> and track record) and the Intersect Resource Allocation Committee (for <u>research merit</u>)
- Applications to Intersect's HPC systems will be made through NCI's forms in October each year
- Applications must be <u>made by Academic Staff</u> at an Intersect member institutions. PhD students can make use of the facilities, the lead CI must be an academic staff member.
- Questions to: hpc\_support@intersect.org.au

## Register with NCI (step 1)

Register **a new Id with NCI**:

http://nf.nci.org.au/accounts/forms/user\_registration.php

This will provide your details to NCI

## Register with NCI (step 2)

#### Apply for **a project from NCI**:

https://nf.nci.org.au/accounts/projects\_new/ APP\_form.php

This will provide link your Id to your Project

### Project Registration Form

- Pick <u>INTERSECT under partner/scheme</u> on the first page of the project registration form or else you won't get access to Orange
- If you're unsure about which machine to get access to, email <a href="mailto:hpc\_support@intersect.org.au">hpc\_support@intersect.org.au</a> who can advise you
- You can add accounts to an existing project also!

#### Conclusion

- In this course we have covered the basics of the Unix command line, transferring data, and the specifics of our HPC machine
- As different machines have different PBS systems, scripts that work on Octane may not work on NCI facilities
- Please complete our survey!
- Any questions?
